Stankevicius: Secure Trade Transactions (S:STT)

Learn how Stankevicius International manages the S:STT process.

1

Client sends the trade contract between the business parties and all other related documents to the deal.

2

Stankevicius reviews the documents and gives a call to the client if required for further questioning regarding the deal.

3

Client deposits the transaction sum to Stankevicius account, and Stankevicius will act as an intermediate to secure client's transfer before releasing it to the end business party.

4

To release the transaction, Stankevicius will follow original contract terms or will release the transaction whenever the client is ready and says so.

5

The transaction scenario example: upon receiving the products or generated airway bill, Stankevicius releases the funds to the end business party.

6

In case the business deal doesn't go through, Stankevicius will return the deposited transaction to the client.

7

S:STT provided to the client against end business party, meaning that money doesn't get sent to the end business party immediately but only after certain terms have been complied with.

8

As an intermediate transaction security controller, Stankevicius will provide all transparency to the client in terms of the money being sent, and all other details related to the transaction.
